

Odds ratios for non-home discharge (n=205; 51 events), per 1-SD increase in each predictor

Crude = each predictor modeled alone. Adjusted = one ridge-penalized multivariable logistic model mutually adjusting for ALL listed covariates (age, female sex, ASA class, no. of operated levels, fusion) plus the three muscle groups (volume + T2 signal). Bold adjusted OR: P<.05. † crude-to-adjusted sign reversal (collinearity/suppression artifact; not interpreted). Squares = point estimate; whiskers = 95% CI; arrows = CI beyond axis range.
